Text and Geometry Custom Commands A custom command is a separate module containing one or more AutoCAD commands. They can be used to create and modify certain parts of drawings. The most commonly used custom commands include: Modify commands (e.g. arrowhead, arc, etc.) Shape commands (e.g. rectangle, circle, polygon, etc.) Custom tool commands (e.g. linetype, profile, spline, etc.) The general syntax of custom commands is: "command_name" "[parameter1] [parameter2] [parameter3]" The "command_name" field represents the name of the custom command. The "[parameter1] [parameter2] [parameter3]" is a specification of the command. When used in the command line for the "Modify" command, the "[parameter1] [parameter2] [parameter3]" are stored as properties of the shape to which the command is applied. Custom commands can be used in the command line to create shapes. Shape commands can also be used in other situations, such as connecting shapes, calculating center points or calculating offsets. When a custom command is created, it is placed in the Custom/ folder on the AutoCAD install media. A custom command can be executed by the command line or the Quick Access toolbar. Creating a Custom Command A custom command can be created using either a GUI dialog or from the command line. In both cases the command is defined by a dialog box called a Property List, the dialog boxes have similar properties. Using a GUI dialog Using the command line Creating a custom command from a dialog To create a custom command from a dialog use the Custom command Create Custom command dialog. In this dialog, specify the name of the command, the shape in which the command is applicable, and a description. The following example shows how to create a custom command from the Custom command Create Custom command dialog. Command Definition Parameters Shape Definition Command Name - The name of the command. This name is the main part of the command specification. Command Definition - The command command_definition parameter specifies the command definition. The command definition is a list of parameters. The command definition is used to define the name of the custom command, the shape in which the command is applicable, and a description. With Markup Import, you can choose to review and add to an existing drawing or import a new drawing to mark up. Quickly incorporate feedback from paper documents or PDFs into your designs. You can import to your favorite drawing, or to shared editing sessions (Video: 3:12 min.) Note that you can only import to a drawing that is open in AutoCAD, and you can import only from files you can open in AutoCAD. Import a document that you've opened in AutoCAD from a file that is not a supported file type. You can apply the same markup to multiple layers. You can also create your own new markup layer for drawing-level changes. (Video: 3:50 min.) Ornamental Line Layer: Draw or import object lines and curves that match their element properties to create ornamental lines (Video: 1:20 min.) Ornamental lines can be used to build unique designs. You can use it to link drawings to make it easier to maintain or reuse, or to quickly draw or paint a line. You can customize how the lines display in the Measurements box (Video: 1:33 min.) You can customize your ornamental lines with new features in the Line property. Layers and Filters: Draw, visualize, edit, and manage layers in drawings. Use any number of new tools to filter, group, and combine layers. Layers are the building blocks of drawings and allow you to quickly organize, print, and share your designs. You can use the new Split Layer command (Video: 2:22 min.) to split a layer into two or more layers. Note: You can't split a layer into more than two layers at a time. You can also apply filters to individual layers. You can also use the new Layer Filter Editor to define a set of layers that share a particular feature. (Video: 1:44 min.) You can also specify the display order of layers. (Video: 2:28 min.) You can manage your layers with a new Settings tab in the Layer Manager. You can customize how your layers are displayed. (Video: 1:30 min.) You can turn on layer visibility, and specify how layers are hidden when the user edits the drawing (Video: 2:05 min.)
