The KBase Keymacro is a programmable macro keypad. It is designed for high productivity applications. By means of its advanced macro functions, the programmable keypad offers a quick and efficient way of doing repetitive tasks. A software development manager has to know the techniques used by programmers in order to make decisions and determine what should be improved in the design and coding phases of the project. In addition, the manager has to be aware of some programmatical analysis techniques used by the programmers when they go through the code. There are a lot of software development manager tools, such as the Rational Rose, available for Windows and Mac. Nevertheless, these tools are generally not free, and this can be a great drawback. Other products offer a free version, but the quality of the code produced is not the best. By using the next product, you will be able to manage the programming tasks better, you will know how to avoid errors and you will be able to use high-quality code when you get to a project. You can also use it in your free time, when you are looking for interesting new programming projects. Keymacro is a code generator

for automating programming and debugging tasks. Programmers use macros to make their work easier and the Keymacro is a programmer macro. The Keymacro also does the repetitive and boring part of the programming. It does code generation, code beautification, code-reading and code-writing. You can also do code-copying, code-filtering, code-simplification and much more. Keymacro 4 is the best version of the Keymacro. It is a Windows program that helps programmers to automatize their coding tasks. You can use macros to write programs and do other tasks, such as creating classes, procedures and methods. You can use Visual Basic, Visual C++, Visual FoxPro, VB.NET, Java, C# and many other programming languages. The entire functionality of Keymacro can be used as a plug-in for Word, Excel, Powerpoint, OpenOffice, Eclipse and more. In order to work with the Keymacro, you have to use Visual Basic programming language. In Visual Basic, you can create the macros that are going to be used by Keymacro. Then you can create or modify a template that will be used by Keymacro when you start a new project. The macros, classes, procedures and methods that are

This invention relates generally to communication systems and particularly to multiplexed radio frequency (RF) receivers of digital communication systems. Communication systems that utilize multiple RF frequency bands require multiple receivers. One type of receiver which is popularly utilized is a superheterodyne receiver. Superheterodyne receivers receive signals of a plurality of different frequencies in the same band. The signals of different frequencies are received and mixed with a local oscillator signal. The resulting signals are filtered and amplified and then applied to an intermediate frequency (IF) stage. The IF stage mixes the amplified signals down to a single frequency. The resultant IF signals are then applied to a demodulator and applied to an output of the receiver.

Another type of receiver which is widely used in RF receivers is the direct conversion receiver. In a direct conversion receiver, a portion of the desired RF signal is mixed with the local oscillator signal in a mixer stage. Thus, the local oscillator frequency is the same as the desired RF frequency. The resultant signals are applied to a filter and to an intermediate frequency stage. The intermediate frequency signal is then filtered and amplified and applied to a demodulator. However, direct conversion receivers have the disadvantage that a local oscillator signal which has the same frequency as the desired RF signal must be applied to the mixer stage. In some applications, it is desirable to be able to receive a digital signal or a time division multiplexed signal and a second signal which is representative of a second digital signal in a single receiver. In one application, the second digital signal is a control signal that is transmitted on a second RF carrier signal which is substantially orthogonal to the first RF carrier signal. The local oscillator signal and the first RF signal are applied to a first mixer stage, and the second RF signal and a second local oscillator signal are applied to a second mixer stage. A filter is

provided to filter out a first IF signal generated by the first mixer stage and a second IF signal generated by the second mixer stage. In one application, the first mixer stage includes a local oscillator signal which is substantially orthogonal to the first RF carrier signal, and the
